

OpenClaw for tourist visas.

Ellis is the first AI agent that processes tourist visas end-to-end — upload once, AI files and tracks everything, user only attends the in-person appointment when required, then receives the visa by email and in the Trip.com portal.

Available in English and Mandarin (简体中文).

24/7 SUPPORT

Hello Chen — good news, your visa has been issued and emailed to you. I'd love to answer any questions you have.

Ask about your visa, documents, I

Agent finishes the file. Visa confirmation in-portal — and by email.

China → Japan tourist visa

In 2025 Japan drew about **9.1 million** Chinese visitors (+30% YoY) — one of the largest single-country outbound corridors from mainland China.¹

- **Email notifications at every key milestone**

Submission, appointment (when required), and visa / Visit Japan Web QR delivery.

- **AI books the earliest appointment**

Instructions include location, date/time, and clear steps for the traveler.

- **AI processes the full file**

Documents → accredited Chinese travel agency / official channel → decision monitoring → delivery.²

- **User effort collapses to three actions**

Upload → attend in-person only if needed → receive visa by email + Trip.com portal.

The AI saves the time. Trip.com owns the experience.

AGENT

Ellis does

- Route classification from origin × destination
- Document pack assembly & official-channel submission
- Earliest appointment booking + traveler instructions
- Status monitoring and visa / QR delivery by email

TRAVELER

Traveler does

- Upload passport & trip details once
- Attend the in-person embassy / VAC appointment only when required
- Open email + Trip.com portal for the finished visa

Powered by Kimi K3 — immigration-tailored.

Kimi K3 (Moonshot AI, China) released **16 July 2026** — a frontier open-weight model. Ellis runs a **modified, immigration-specific** profile with agent tools Trip.com's public chat UI alone does not have.³

Why Kimi K3 (not Fable 5)

- **China-origin model** — better jurisdiction fit and privacy for Chinese travelers
- **Open / open-weight path** — self-hostable; Moonshot need not see applicant files
- **Cost** — avoids expensive closed-API token burn at tourist volume
- **Agent layer in Ellis** — chatbots answer; Ellis files, books, and delivers

Self-hosting = Trip.com control

Applicant documents stay inside infrastructure controlled by Trip.com. Moonshot does not receive private case files. Only Trip.com holds traveler PII for the visa workflow.

Recent research has placed the K3 model above Fable 5 in performance. tomshardware.com/.../moonshot-releases-2-8-trillion-parameter-kimi-k3³

Why pay Ellis — not “just use Kimi”?

Why not use the public Kimi chatbot ourselves?

Public chat lacks Ellis’s agentic visa pipeline — official-channel submission, earliest appointment booking, document pack assembly, monitoring, and email/portal delivery. Ellis makes “one click” real in the background.

Why not Fable 5 (Anthropic)?

US-hosted frontier APIs raise cross-border privacy concerns for Chinese traveler documents, are token-expensive at scale, and still need an Ellis-class agent layer to file visas. Kimi’s open-weight path enables Trip.com-controlled hosting.

Why not OpenClaw alone?

Generic agents are not designed for immigration workflows, forms, consular calendars, or destination-specific channels (e.g. Japan’s accredited-agency path for mainland China).² Ellis is purpose-built — and keeps data under Trip.com.

First of its kind. An edge for Trip.com.

Category creation

Ellis is the first AI built to process tourist visas agenticly — not a chatbot bolted onto booking.

For Trip.com, that is a product wedge Booking.com does not have: visas that complete themselves after upload.
