

OpenClaw for *tourist visas.*

Ellis is the first AI agent that processes tourist visas end-to-end — upload once, AI files and tracks everything, user only attends the in-person appointment when required, then receives the visa by email and in the Trip.com portal.

One-click filing

Powered by Kimi K3

Immigration-tailored · self-hosted

Three steps. Emails throughout.

China → Japan tourist visa

Japan was the #1 destination for Chinese visitors in 2025 — about **9.1 million** arrivals — the largest single outbound corridor into Japan.¹

- Email notifications at every key milestone
Submission, appointment (when required), and visa / Visit Japan Web QR delivery.
- AI books the earliest appointment
Instructions include location, date/time, and clear steps for the traveler.
- AI processes the full file
Documents → agency / official channel → decision monitoring → delivery.
- User effort collapses to three actions
Upload info → attend in-person appointment if needed → receive visa by email + Trip.com portal.

What the traveler sees

Concise Trip.com emails (no third-party clutter). Portal shows flags, progress, and “Visa complete!” with confirmation sent.

For mainland China → Japan, filing follows MOFA practice: accredited Chinese travel agency intake; Japanese mission decides.²

The AI saves the time. *Trip.com owns the experience.*

This is OpenClaw — purpose-built for tourist visas.

Ellis does

- Route classification from origin × destination
- Document pack assembly & official-channel submission
- Earliest appointment booking + traveler instructions
- Status monitoring and visa / QR delivery by email

Traveler does

- Upload passport & trip details once
- Attend the in-person embassy / VAC appointment only when required
- Open email + Trip.com portal for the finished visa

Powered by Kimi K3 — *immigration-tailored.*

Kimi K3 (Moonshot AI, China) released **16 July 2026** — a frontier open-weight model. Ellis runs a **modified, immigration-specific** profile with agent tools Trip.com's chat UI alone does not have.³

Why Kimi K3 (not Fable 5)

- **China-origin model** — better jurisdiction fit and privacy posture for Chinese travelers than a US-hosted frontier stack
- **Open / open-weight path** — self-hostable; Moonshot does not need applicant files if Trip.com hosts the stack
- **Cost** — avoids expensive closed-API token burn at tourist volume
- **Agent layer lives in Ellis** — chatbots answer; Ellis files, books, and delivers

Self-hosting = Trip.com control

Applicant documents stay inside infrastructure controlled by Trip.com. Moonshot does not receive private case files. Only Trip.com holds traveler PII for the visa workflow.

On public leaderboards at launch, K3 ranked among the top global models (reported behind Anthropic's Fable 5 on Artificial Analysis; ahead on some Arena front-end evals).³ Ellis's edge is the immigration agent — not chat alone.

Why pay Ellis — not “just use Kimi”?

Why not use the public Kimi chatbot ourselves?

Public chat lacks Ellis’s agentic visa pipeline — official-channel submission, earliest appointment booking, document pack assembly, monitoring, and email/portal delivery. Ellis makes “one click” real in the background.

Why not Fable 5 (Anthropic)?

US-hosted frontier APIs raise cross-border privacy concerns for Chinese traveler documents, are token-expensive at scale, and still need an Ellis-class agent layer to file visas. Kimi’s open-weight path enables Trip.com-controlled hosting.

Why not OpenClaw alone?

Generic agents are not designed for immigration workflows, forms, consular calendars, or destination-specific channels (e.g. Japan’s accredited-agency path for mainland China).² Ellis is purpose-built — and keeps data under Trip.com.

First of its kind.

An edge for Trip.com.

Category creation

Ellis is the first AI built to process tourist visas agentially — not a chatbot bolted onto booking.

For Trip.com, that is a product wedge Booking.com does not have: visas that complete themselves after upload.

What Trip.com gets

- Higher conversion on complex outbound routes (China → Japan / Schengen / USA)
- Lower human ops cost per visa
- Branded emails + portal — Trip.com owns the customer moment
- Self-hosted option — documents never leave Trip.com-controlled infra

Sources & footnotes

1. Japan #1 for Chinese visitors (2025). ~9.1 million Chinese arrivals to Japan in 2025 — largest single source market that year.
