

From *\$1K* to *\$20–50K MRR*
in six months.

Outbound with an unfair advantage: *the target list is public.*

The US government publishes every visa sponsor. DOL LCA disclosure files list every H-1B employer, role, wage, and law firm — refreshed quarterly. Ellis's ideal customers are literally a downloadable list.

AI runs the outbound — *drafted, sent, and followed up* without a human.

The same AI that runs Ellis cases runs Ellis sales: a pipeline that turns public filing data into personalized, ready-to-send email sequences at 10× founder speed.

AI-DRAFTED FROM PUBLIC FILING DATA — EXAMPLE

"Hi Sarah — **deep24** certified **2 H-1B LCAs** in Q2 (software engineers, SF) — that's roughly **\$20K+ in counsel fees** plus renewals, amendments, and compliance you now own. Ellis runs that entire lifecycle with AI and your counsel only signs off. 15 minutes this week? I'll run one of your actual visa scenarios live."

The math of automation: 300 emails/day ≈ 6,000/month → at a 4% reply rate and 30% demo conversion, that is ~70 qualified demos a month — 10× the pipeline this plan needs.

\$1K per sponsored employee. *\$50K is 25 small customers.*

Startup — 2 sponsored employees

\$2K / month

2 × \$1K — vs \$20K+ in counsel fees for the same two cases

Scaling team — 5 sponsored employees

\$5K / month

5 × \$1K — one customer covers a quarter of the \$20K goal

Mid-market — 10+ sponsored employees

\$10K+ / month

One deal at qq.com / VPEA scale is 20–40% of the entire target

Average customer = **2 sponsored employees × \$1K = \$2K MRR** · $\$50K \div \$2K =$ **25 customers**
· = **~4 closes/month** — against ~70 AI-sourced demos a month, a **6% close rate** gets there.
The funnel assumes 25%.
