

-What data will your website allow users to search?

NYC study spots (libraries, campus buildings, etc.) so users can search by neighborhood, Wi-Fi quality, hours, how noisy it is, etc.

- What is an example of a person who would want to search this and why?

A Columbia student who needs a reliable place to study between classes and wants to find spots that are quiet, and stay open late near where they already are (like in Morningside Heights)

- Show an example of one item in the database, and say how the data fields help

the user achieve their goal.

4) {

"id": 1,

"name": "Butler Library (Columbia)",

"image\_url": "https://upload.wikimedia.org/.../butler.jpg",

"year\_opened": 1913,

"summary": "Butler Library is a classic campus study space with large reading rooms and strong academic vibes. It is usually quiet, especially on upper floors, and it has many seats for long study sessions. It is convenient for students who have classes nearby and want minimal travel time. During busy weeks it can fill up, so knowing the best times to go is helpful.",

"avg\_noise\_level": 2,

"outlets\_score": 4,

"wifi\_score": 5,

"hours": "9am–12am",

"tags": ["quiet", "library", "lots of seating", "campus", "good wifi"],

"nearby\_subway": ["1 (116 St–Columbia)"],

"similar\_spot\_ids": [2, 5, 7]

}

The tags let users search for needs like “quiet” or “outlets”

The numerical scores (noise/outlets/Wi-Fi) help compare options

The hours field helps users avoid places that close too early

The similar\_spot\_ids lets your site recommend other good matches after viewing one spot
