

-What data will your website allow users to search?

NYC study spots (libraries, campus buildings, etc.) so users can search by neighborhood, Wi-Fi quality, hours, how noisy it is, etc.

-What is an example of a person who would want to search this and why?

A Columbia student who needs a reliable place to study between classes and wants to find spots that are quiet, and stay open late near where they already are (like in Morningside Heights)

- Show an example of one item in the database, and say how the data fields help the user achieve their goal.

{

"id": 1,

"name": "Butler Library (Columbia)",

"image_url":

"https://upload.wikimedia.org/wikipedia/commons/a/aa/Butler_Library_Columbia_University.jpg",

"neighborhood": "Morningside Heights",

"borough": "Manhattan",

"address": "535 W 114th St, New York, NY 10027",

"year_opened": 1913,

"summary": "Butler Library is a nice campus study space with large reading rooms. It's usually quiet, especially on upper floors, and it has many seats for long study sessions. It's convenient for students who have classes nearby. During busy weeks it can fill up, so knowing the best times to go is helpful.",

"avg_noise_level": 2,

"outlets_score": 4,

"wifi_score": 5,

"hours": "9am–12am",

"tags": ["quiet", "library", "lots of seating", "campus", "good wifi"],

```
"nearby_subway": ["1 (116 St–Columbia)"],  
"similar_spot_ids": [2, 5, 7]  
}
```

tags let users search for needs like “quiet” “library” or “good wifi”

the numerical scores (noise/outlets/Wi-Fi) make it easy to compare places

hours helps users avoid spots that close too early

neighborhood/borough/address helps location-based searching

similar_spot_ids enables recommendations after looking at one result
