

Process a visa, in one click.

To the Trip.com team,

A Trip.com customer can already book the flight, the hotel, and the ride to the hotel in one place. The visa is the only piece missing. It is the one step travelers still have to figure out on their own.

Ellis closes that gap. It is an AI agent that fills out and submits the visa application for the user in one click. The user uploads their documents, and Ellis does the rest. That saves travelers a lot of time, and nobody is left to work out the process alone.

Ellis solves captchas, performs the payment on the embassy website, and completes the application, all within seconds. It also schedules the visa appointment through Trip.com, helps users renew an expired passport, monitors their immigration process 24/7, and includes an AI chatbot for immigration questions throughout the trip. The traveler simply lets Trip.com do the job. The future of traveling is AI powered; the old way of handling visa processing yourself is ending.

With Ellis, Trip.com can sell the full package. Instead of leaving the website to pay the embassy, the customer pays Trip.com to perform the visa processing. That keeps users on Trip.com and improves retention.

Ellis is the first of its kind, the first ever global visa processing tool, and it does not run on tokens; it is a fully revolutionary AI tool. Travelers cannot find this anywhere else. A general AI like Kimi K3 or ChatGPT will decline the task under those companies' privacy guidelines, and those tools are not agents anyway, so they cannot file or track an application. Ellis is how Trip.com stands apart from every competitor.

We would be glad to give Trip.com a free trial to test the software. I would also like to show you a live visa processing session using a real Chinese passport.
