

Process a visa, in one click.

To the Trip.com team,

A Trip.com customer can already book the flight, the hotel, and the ride to the hotel in one place. The visa is the only piece missing. It is the one step travelers still have to figure out on their own.

Ellis closes that gap. With Ellis integrated, a customer gets the full package, visa included, and everything happens on Trip.com. Nobody has to leave the website.

Ellis is the first software of its kind, an AI agent that processes tourist visas globally from start to finish. Travelers cannot find this anywhere else. If they feed their information to a general AI like Kimi K3 or ChatGPT, the privacy guidelines at those companies mean the model will decline the task. Those tools are not agents either, so they could not file or track an application even if they tried. Ellis was built for exactly this job.

It is also inexpensive. Ellis runs on a version of the Kimi K3 AI that was modified specifically for Ellis, and it runs locally. Other AI software charges for tokens; Ellis runs free of cost.

For Trip.com, this makes the whole workflow more effective. Users no longer have to work out the visa process by themselves, so travel gets easier and faster for customers around the world. Competitors do not offer anything like it. That gives travelers one more reason to come to Trip.com, and to stay there, for something they cannot get anywhere else.
