

a. Application I like

Google Maps (mobile app)

b. Screenshot

C. 1 . Visibility of system status

Google Maps gives a lot of constant feedback. I can see my position moving, my next turn, updated ETA, and whether traffic is slowing me down or not. If I somehow miss a turn, the route updates really fast so I know the app is responding right away.

2. Match between system and the real world

The app speaks in terms that a lot of people already understand. It uses roads, landmarks, and directions like “Turn left in 67 feet.” The map mirrors really well what you see outside, which makes it easier to trust the instructions and follow them without thinking about it too much.

3. Error Prevention

Google Maps helps you recover from mistakes without making you stop and fix things. If you make a wrong turn, it recalculates automatically and gives a new plan instead of panicking and asking you to re-do everything. Therefore, this method keeps us moving and reduces stress, especially in places the user might not know too well.
