

I spent about two hours exploring the Hall of Human Origins, the Hall of Planet Earth, and the Sense of Scale area. The Hall of Human Origins was the most memorable for me. Standing in front of the early hominid skeletons helped me picture how our ancestors lived and moved, and seeing the differences in their bodies made human evolution feel more real. I included a photo from this exhibit because it was the moment that stayed with me the most. I also enjoyed the Hall of Planet Earth. The bronze globe and the surrounding displays explained Earth's structure and climate in a way that was easy to follow. I stopped there for a while to study the continents because the model really encouraged me to think about how Earth's shape has changed over time.

These exhibits related a lot to topics we covered in Frontiers of Science. The Hall of Human Origins matched the evolution lessons because it showed fossil evidence for how our species developed. The Hall of Planet Earth related to the climate module because it showed a lot about natural and human influences on global temperature. The Sense of Scale area was related to the physics module because it compared objects across many size ranges and showed how scientists study both the very small and the very large. Seeing these concepts in person helped me understand how the modules relate to each other and how they explain the world around us. It was really nice! :)
