

Technical Prototype Warm-Up: Skin Care Website

Group: Solo group - Sam

1. TA Feedback on Technical Prototype

What is working well from HW10:

- The technical prototype has a clear direction and purpose: a functional website focused on skin care.
- The main idea is understandable, and the prototype shows the basic structure of the website experience.
- The project is moving toward a useful product where users can interact with skin care-related content and features.

What still needs work:

- The TA feedback was that the prototype needs less text and more images so the website feels more visual and user-friendly.
- The site should rely more on product images, skin care visuals, icons, or visual sections instead of large blocks of writing.
- The website still needs more technical implementation so it works as a fully functional prototype, not just a static layout.
- The next step is to make the user flow clearer and more interactive, especially for skin care recommendations, product/content browsing, and any main website features.

2. Job Assignments / Solo Implementation Plan

Since this is a solo group, Sam is responsible for all roles, including design, technical implementation, content, testing, and final submission.

Sam's implementation plan for this week:

- Reduce the amount of text on the website and replace long written sections with more images and visual elements.
- Add skin care-related images, product cards, icons, or visual sections to make the site more engaging.
- Continue building the functional parts of the website so users can interact with the prototype.
- Improve the layout so the website looks cleaner, easier to navigate, and more polished.
- Test the website flow and fix any issues so the technical prototype feels complete and ready to use.
