

What this site does and who it serves

a) What data will your website allow users to search?

NYC study spots — libraries, cafes, campus buildings, and outdoor desks across Manhattan. Each entry is rated on noise, outlet availability, and Wi-Fi quality, and is tagged by vibe ("Quiet Library", "Cozy Cafe", "Modern Group Study", "Outdoor Reading", etc.) so a student can find a spot that fits the day.

b) What is an example of a person who would want to search this and why?

A **Columbia student** in Morningside Heights who has a 90-minute gap between back-to-back classes and needs to finish a problem set. They want a spot that is *quiet enough* to focus, has *outlets and Wi-Fi* for their laptop, and is *close to the buildings they are already walking between*. After Butler fills up during midterms, they need a fast way to find a comparable spot without scrolling through a generic Yelp list.

c) What information on this page should help the user issue a new search? And why?

- **Vibe pill** on the photo ("Quiet Library", "Cozy Cafe", ...) acts as a one-tap shortcut to spots that share the same feel. The user can decide "I want more places like this" without remembering specific keywords.
- **Neighborhood + borough** in the eyebrow are clickable. They let a student stay inside their geographic constraint ("more Morningside Heights options") so they don't have to type a location query.
- **Tags** below the summary (#quiet, #outlets, #large desks, #coding, ...) are individually clickable chips. They are the shortest possible substring searches because they map exactly to what students already search for.
- **Similar spots** cards at the bottom let the user keep exploring without going back to the search bar - this turns one successful search into several useful follow-ups.
- **Subway lines** are listed in a side card. They let a user swap to a different spot near the same train if their first pick is full.

QUIET LIBRARY

MORNINGSIDE HEIGHTS · MANHATTAN

Butler Library
(Columbia)

535 W 114th St, New York, NY 10027

HOURS

9:00 AM - 12:00 AM

· opened 1934

[edit this entry](#)

At a glance

NOISE

2 /5

1 = silent · 5 = loud

OUTLETS

4 /5

1 = scarce · 5 = plenty

WI-FI

5 /5

1 = spotty · 5 = strong

Why students go

Butler Library is one of the most reliable study spaces for Columbia students because it offers many seats and long tables. The upper reading rooms are usually quieter than the lower floors, so it works well for focused assignments.

VIBE SHORTCUT

More "Quiet Library" spots ->

GROUP 1 - Identity / Hero

Concept & user goal:

"Is this the spot I think it is?" - the student verifies the place at a glance before reading anything else.

Most important info:

Photo + name + neighborhood. Image is the fastest recognizer; name and neighborhood confirm.

Tools (squint test):

Largest size on page, top-left primacy, full-bleed photo, accent vibe pill, serif name type breaks hierarchy.

GROUP 2 - Decision Metrics

Concept & user goal:

"Will this spot work for what I need today?" Decide in seconds whether to keep reading.

Most important info:

Wi-Fi score - most decisive for laptop work - is highlighted with the amber accent so it pops first.

Tools (squint test):

Gestalt similarity (3 identical stat cards), proximity, large numerals, pip bars, color reserved for top metric.

GROUP 3 - Context & Discovery

Concept & user goal:

"If this works, take me deeper. If not, take me somewhere similar." Supports continued exploration.

Most important info:

Tags + vibe shortcut + nearby subway - each issues a new search with one click.

Tools (squint test):

Pill-shape repetition (similarity), uppercase subheads as wayfinding, amber chip marks the strongest CTA.

Squint test: with the page blurred, the photo (G1) reads first, then the three large numerals and the amber Wi-Fi card (G2), then the amber "More Quiet Library spots" chip (G3). Amber is reserved so it only marks the highest-priority element in each group.
