

T-Station Visa Information Base: confirmed answers

To: Trip.com Group, Visa & Insurance Business Unit · Attn: Hazel Huang

Every answer below describes what is live on ellis-visa.com today.

QUESTION 1 · DATA ACCURACY ASSURANCE how accuracy is guaranteed in the system

① Who are the "humans" in the Human-verified segment: Ellis's team, outsourced labelers, or Ctrip's operations?

Ellis's own reviewers. One person writes a fix, a different person approves it, and nobody can approve their own work. No outsourced labelers. Trip.com operations uses the same console, and its edits are stamped "Trip.com operations".

② For Source-checked, which fields are compared, how long is the freshness window, and is re-verification automatic?

Ellis reopens the page each record cites and compares requirement, fee, currency, stay, validity, entries, documents, processing time, channel and product list. Every record is rechecked at least every 48 hours, and again when an expired one is opened. A site that blocks robots does not cost a record its last good read. The Freshness tab shows attempted and read separately.

③ How is confidence calculated? How are multi-source conflicts handled? How is a person notified when a low-confidence answer is intercepted?

High: a person verified the record against a named official page. Medium: an official source with a few blanks. Low: never shown, customers see "we are checking this route". When sources disagree, the destination's page for that nationality wins and each source keeps its own link. Whatever the machine cannot settle goes to the correction queue at once.

④ How is the 48-hour commitment for policy changes guaranteed at the system level?

The sweep re-reads every record's page within 48 hours and corrects differences itself, saving the quote. A fix is data, so the next reader gets it immediately. Every step is timestamped, so the clock is measured.

QUESTION 2 · SUPPLEMENTING MISSING INFORMATION

① What is the mechanism for filling gaps like the South Korea zero and the incomplete Australia visa types?

Every blank cell is missing, not published, or not applicable, and says which. Missing cells are researched until they close. The Korea zero was a display filter bug, fixed with tests. Australia's multi-year visas are live. Completeness is 99.9%, with two fee cells open where a consulate publishes its schedule only as an image.

② Can Ctrip's operations team edit or add fields on their own, or does it depend on Ellis?

Fully self serve. Add a route with Ellis AI or by typing the fields, edit any field, and refresh any record from its official page. Every change needs an official link and a note.

QUESTION 3 · INSTALLATION PACKAGE FOR LOCALIZATION ACCEPTANCE

Delivered as a zip with a Docker Compose package: one command starts the backend and website with a database snapshot, so acceptance works offline.

QUESTION 4 · VERIFYING POLICY UPDATE TIMELINESS IN PRACTICE

① How do we simulate a policy change and measure the whole process from detection to correction to confirmation to launch?

Flag a field: that is T0. Ellis corrects, a second person reviews, it publishes, and every stage stamps its time. The Freshness tab shows the next automatic re-check and the share of the database re-checked in the last 48 hours. Today it is all of it.

② Is there a change notification mechanism (email or system reminder) for the operations team?

Yes. Every add, modify and delete is pushed as JSON to a webhook you name, which fits Slack, Teams, Feishu or an email bridge. The change log keeps before and after values, and open tabs show a refresh banner. Give us the address and it is on the same day.

QUESTION 5 · BACKEND OPERATIONS MANUAL AND DATA CALIBER SPECIFICATION

Both delivered as English PDFs dated 3 September 2026, with bilingual web versions kept in step with the live system.

- **Add a route two ways.** "Add with Ellis AI" answers it from official pages in one move, or type the fields yourself.
- **Edit any field** of any record, with the source link and note stored on the record.
- **Refresh from source** on every record: re-reads the official page on demand and says plainly when nothing needs updating.
- **Automatic 48-hour re-check** of every record, with a live countdown to the next run and 48-hour coverage shown on the Freshness tab.
- **Flag, AI check, accept or decline.** Flag a field and Ellis AI checks it against the official page and proposes the fix. An operator accepts or declines in one click.
- **AI Q&A review tab.** Every exchange is logged. Mark it correct or wrong, and wrong opens a correction issue on that route.
- **Multi-turn bilingual Q&A** that follows the site language, remembers the passport across the conversation, and offers follow-up chips.
- **Special policy notes** with a clear covered-or-not line per nationality: Hainan, 240-hour transit, Korea group scheme.
- **Validity shown on every record**, and exact country filtering (the Korea and India filter bug is fixed with regression tests).

SUPPORT

A dedicated maintenance engineer covers the website 24/7, on top of automatic monitoring, daily backups and the 48-hour re-check.

Status on 3 September 2026: 1,360 records, 99.9% complete, 100% citing an official source, zero low-confidence records, every record re-checked within 48 hours.
