

Ellis 信息质量管控后台 操作手册

Ellis Information Quality Control Backend, Operations Manual · 版本 2026-09-01 · 交付物清单第10项 Deliverable No. 10

1. 访问方式

Access

浏览器打开 `https://ellis-visa.com`，点击右上角「质控台」进入后台。无需安装，无需配置，无需申请账号。测试权限已预置。

Open `https://ellis-visa.com` in a browser and press "Quality console" in the header. No install, no setup, no account application. Test access is preconfigured.

右上角地球图标可切换语言：English、简体中文、繁體中文。界面与数据说明同步切换。

The globe icon switches the language: English, Simplified Chinese, Traditional Chinese.

2. Records 记录抽查

Multi-dimensional spot check

Records 页承载全量抽查。筛选条件可任意组合：

The Records tab carries the full spot check. Filters combine freely:

筛选 Filter	说明 What it does
护照 Passport	站点维度。输入国名、中文名或代码，例如 China、中国、CHN、CN。 The station dimension. Type a name in either script or a code.
目的地 Destination	同上。输入 KOR 或 South Korea 只会返回韩国记录。 Same input rules. Typing KOR or South Korea returns only South Korea records.
目的 Purpose	旅游、商务、探亲、留学、工作、过境、其他。
签证要求 Visa requirement	免签、落地签、需提前办理等一级分类。
置信度 Confidence	高、中、低。
签证类型 Visa type	按类型名称包含匹配，例如 tourist。

证件类型 Passport type	普通护照、外交护照等13种。
缺失字段 Missing field	只看某字段仍缺失的记录，用于补齐工作。

四个指标卡实时反映当前筛选结果：记录数、完整度、信源覆盖率、置信度分布。完整度卡片同时给出两种口径：可填口径（分母剔除「不适用」与「官方未公布」）和字面口径（25必填字段的原始计数）。

The four tiles follow the current filter: record count, completeness, source coverage, confidence split. The completeness tile shows both calibers: fillable (excluding does-not-apply and not-published cells) and the literal count over required cells.

点击任意行展开完整25字段记录。每个字段带状态标记：

Click a row to expand the full 25-field record. Every field carries a status:

已填 filled

官方未公布 not published

不适用 does not apply

缺失 missing

展开卡底部是「标记问题」表单：选择字段、写明疑点、提交。提交即进入纠错队列。

The flag form at the bottom of the card files a field-level issue straight into the correction queue.

2b. 新增线路与编辑字段

Adding routes and editing fields

Records 页的「新增线路」卡片提供两种方式：

The Add a route card on the Records tab offers two ways in:

- 1

用 Ellis AI 添加。选护照、目的地、目的与证件，点一次按钮。Ellis 即时作答并对照该线路的官方页面核验，结果直接进入记录列表；低置信度答案先拦截，核对后展示。

Add with Ellis AI. Pick the route and press once: Ellis answers it and checks the official pages in the same move. A low-confidence answer is held until checked.
- 2

人工录入。切换「手动填写」，运营逐项输入费用、停留、办理时长、材料等字段，必须附官方来源网址与说明。保存后立即对读者生效，来源标注为携程运营。

Manual entry. Switch to manual and type the fields yourself. An official source URL and a note are required; it serves immediately with Trip.com operations as the provenance.

展开任意记录可用三个按钮：「编辑字段」打开覆盖全部可编辑字段的表单（判定下拉、当前签证行的效期/次数/费用、费用与停留、申请方式、入境卡、官方未公布勾选），预填当前值，只写入改动项；「从官方来源刷新」让 Ellis 当场重读官方页面，信息一致时明确告知「仍是最新，无需刷新」，有差异时按页面修正并留痕；「标记」提交人工质疑后，Ellis 会自动去读官方页面，并把核

对结果作为修正建议放入纠错队列，运营可一键接受（写入带来源的修正，读者立即看到）或拒绝。

Every expanded record has three buttons. Edit fields opens a form covering every editable field (verdict dropdowns, this visa row's validity, entries and fee, money and stay, how to apply, arrival card, and not-published checkboxes), prefilled with current values and writing only what changed. Refresh from source has Ellis re-read the official page on the spot: when nothing changed it says so plainly, and differences are corrected from the page with the change logged. Flag files a human report, after which Ellis reads the official page itself and places what it found in the Correction queue as a proposal the operator can accept in one click (a sourced correction the next reader sees immediately) or decline.

3. Correction queue 纠错队列

The five-stage loop

每条问题沿验收标准4.1.2的五个阶段推进，每个阶段一个按钮，顺序不可跳过：

Every issue walks the five stages of standard 4.1.2, one button per stage, no skipping:

1 标记 open。读者或运营在记录上发起。

A reader or operator flags a field.

2 已通知信息方 acknowledged。记录信息提供方已获知。

The information provider has been told.

3 已修正 corrected。写明修正内容后提交。旧答案立即从服务中撤下。

The fix is written and the old answer is withdrawn at once.

4 已复核 reviewed。必须由修正人以外的运营复核，系统强制。

A second operator reviews. The system enforces the separation.

5 发布上线 published。修正后的答案对读者生效。

The corrected answer goes live.

任一阶段可选择「不处理 dismissed」，但必须写明原因。整个闭环目标不超过48小时，每个阶段的时间戳都被记录，可导出核验。

Dismissal needs a written reason at any stage. The end-to-end target is 48 hours and every stage is timestamped.

4. Change log 变更记录

Add, modify, delete

每次影响读者可见内容的更新自动写入变更记录，区分新增、修改、删除三类，修改类带逐字段前后对照。答案因纠错被撤下时会写入删除记录。支持全文搜索，覆盖全部历史。

Every reader-visible update writes a change entry: add, modify or delete, with field-level diffs. Withdrawing an answer through the correction loop writes a delete entry. Search runs over the full history.

5. AI 问答抽查

Sampling the assistant

AI 问答页列出智能助手实际回答过的每一次交互：问题原文、读取的线路、给出的答案、引用来源。运营对每条可作裁定：

The AI Q&A tab lists every exchange the assistant actually served: the question, the route it was read as, the answer and the cited source. Each exchange takes a ruling:

正确 correct 记录复核人与时间。

有误 wrong 必须写明问题所在，系统自动就该线路立一条纠错队列问题，走完整闭环。

Ruling an answer wrong requires a written reason and files a tracked issue on the answered route automatically.

6. Freshness 时效监控

The freshness monitor

系统定期重读官方页面。与记录一致则重新盖章。与人工核验事实不一致时不会自动改写，而是生成一条争议，附页面原文、当前记录值与引文，等待人工裁定。裁定后走纠错队列发布。页面上方的可用性卡片展示当月按分钟计的在线率。

Official pages are re-read on a schedule. Agreement restamps the record. Disagreement with a human-verified fact files a dispute with the page quote for a human ruling instead of overwriting. The availability tile shows the month's per-minute uptime.

Ellis 每 48 小时内自动将每条已提供的答案与其官方页面重新核对一次（系统定时任务，最久未核对优先）。Freshness 页顶部显示「下一次全量数据刷新」倒计时，读取的是定时任务本身的下次运行时间，不是估算。

Ellis automatically re-reads every served answer against its official page at least every 48 hours (a scheduled sweep, oldest first). The Freshness tab opens with a countdown to the next full refresh, read from the sweep timer itself rather than estimated.

7. 批量导出

Batch export

Records 页的「导出 Excel」按当前筛选条件导出 .xlsx。文件含两张工作表：数据表（25字段+来源+置信度）与字段说明表。字段说明表首行标注快照时间（UTC）。导出无行数上限，工作簿构建在12,000行实测1.2秒。

Export Excel follows the active filters. Two sheets: data (25 fields plus sources plus confidence) and field descriptions, stamped with the UTC snapshot time. No row cap exists in code. Workbook build measured 1.2 seconds at 12,000 rows.

8. 低置信度拦截与放行

Holds and release

按4.2.3分级为「低」的答案不对读者展示，读者只会看到「正在核对该线路」。放行有两条路：一是研究后写入经官方来源核验的事实（推荐），二是运营在核对官方页面后手动放行。两条路都会留下可审计的记录。

A Low-graded answer is withheld and the reader sees "We are checking this route". Release happens by writing source-verified facts (preferred) or by an audited manual release after checking the official page.

9. 深链

Deep links

数据库每条线路有稳定链接，形如 `#database/CHN/JPN/tourism`。链接可直接分享，打开即达对应记录页。

Every route has a stable deep link that opens the record page directly.

遇到与官方页面不一致的内容，请直接在记录上标记问题。这是最快的修正通道，全程可追踪，目标48小时内闭环。

If anything disagrees with an official page, flag it on the record. That is the fastest correction channel, fully tracked, with a 48 hour closure target.
